Report Overview

UV Curing Solder Resist Ink refers to a type of ink used in the printed circuit board (PCB) manufacturing process. This ink is applied to the surface of the PCB to protect the areas where soldering is not required. It is typically green in color and contains photo-initiators that enable it to cure rapidly when exposed to ultraviolet (UV) light. The UV light triggers a chemical reaction in the ink, causing it to harden and form a protective layer that prevents solder from adhering to the surface. UV curing solder resist ink offers excellent adherence, high thermal resistance, and electrical insulation properties, ensuring the reliability and longevity of the PCB.
