Abstracts

Ultraviolet light-emitting diode (UV LED) direct imaging systems are advanced photolithography equipment used primarily in the printed circuit board (PCB) and semiconductor manufacturing industries to transfer high-precision circuit patterns directly onto substrates without the need for physical photomasks. These systems utilize UV LEDs as the light source to expose photoresist materials, offering significant advantages over traditional mercury-vapor lamp systems, including lower energy consumption, reduced heat generation, longer operational lifespan, instant on/off capability, and enhanced environmental friendliness due to the absence of hazardous mercury. The technology enables finer line resolutions, improved alignment accuracy, and greater production flexibility, making it particularly suitable for prototyping, high-mix low-volume production, and applications requiring rapid design iterations.

The global Uv Led Direct Imaging System market size was estimated at USD 620.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
