Abstracts

Ultraviolet (UV) LED surface light sources are semiconductor-based devices designed to emit ultraviolet light across a broad, uniform area rather than from a concentrated point, utilizing light-emitting diodes (LEDs) that operate primarily within the UVA (315-400 nm) or UVB (280-315 nm) spectral ranges, and in some specialized cases, UVC (100-280 nm). These systems often incorporate arrays of UV LEDs arranged beneath diffusing optical materials to ensure even irradiation distribution, making them suitable for applications requiring consistent exposure over flat or curved surfaces, such as UV curing of coatings, inks, and adhesives in industrial manufacturing; disinfection and sterilization of equipment and environments in healthcare and food processing; and photochemical processes in electronics and medical device production. The technology is characterized by its energy efficiency, long operational lifespan, instant on/off capability, and minimal heat generation compared to traditional mercury-vapor UV lamps, aligning with global trends toward environmentally sustainable and safer alternatives.

The global Uv Led Surface Light Source market size was estimated at USD 750.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
