Abstracts

Uv Light Air Purifiers are devices that combine traditional air filtration methods such as HEPA or activated carbon filters with ultraviolet (UV) light technology, specifically UVC wavelengths, to neutralize airborne pathogens, including viruses, bacteria, mold spores, and other microorganisms, by disrupting their DNA or RNA and preventing replication. These systems are designed to improve indoor air quality by not only capturing particulate matter like dust, pollen, and pet dander but also targeting microorganisms that conventional filters may not eliminate. The integration of UV light aims to provide an added layer of disinfection, making these purifiers particularly relevant in settings where sanitization and reduction of biological contaminants are priorities, such as healthcare environments, schools, offices, and households concerned with hygiene.

The global Uv Light Air Purifiers market size was estimated at USD 1020.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
