Abstracts

In the semiconductor manufacturing process, the non-UV tape used for wafers is usually called blue film. UV and non-UV tapes are mainly used in semiconductor grinding, cutting processes and packaging. Whether it is grinding tape or cutting tape, it includes non-UV tape (Non-UV Tape) and UV tape (UV Tape). Non-UV type is a general traditional pressure-sensitive tape. Considering the easy peeling, its adhesion is generally lower than that of UV type (before UV exposure), about 100~400 gf/25mm; UV tape is a pressure-sensitive tape with high adhesion strength before exposure. After exposure to UV light, its peeling force will be greatly reduced. It not only has strong fixation to the adherend, but also has the advantage of easy peeling after the process purpose is achieved. Wafer back grinding tape (BG Tape) is mainly used for the protection and fixation of the front circuit of the wafer during the back grinding and thinning after the wafer is completed, and to prevent damage to the front circuit of the wafer during the back grinding of the wafer. Dicing tape is mainly used for fixing, cutting, expanding, UV debonding, and separation in semiconductor wafer and packaging processes. DAF film is used to bond chips and substrates during semiconductor packaging.

The global Uv And Non Uv Tape For Semiconductor market size was estimated at USD 683.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
