Abstracts

UV oligomers and monomers are key raw materials used in radiation-curable formulations. Monomers are low-molecular-weight reactive diluents that control viscosity and influence curing speed, adhesion, and surface properties. Oligomers, typically urethane acrylates, epoxy acrylates, and polyester acrylates, are higher-molecular-weight prepolymers that determine the mechanical, chemical, and weathering performance of the cured film. When exposed to ultraviolet (UV) light in the presence of photoinitiators, these components undergo rapid polymerization to form cross-linked coatings, inks, adhesives, and 3D printing resins. The upstream of the UV oligomers and monomers industry mainly consists of petrochemical derivatives such as acrylic acid, methacrylic acid, polyols, isocyanates, and epoxy resins. The midstream sector involves formulators and chemical producers that synthesize oligomers and monomers, and then blend them into UV-curable systems. Downstream applications include printing inks, industrial and wood coatings, electronics coatings, adhesives, optical fibers, and additive manufacturing, where UV curing provides advantages of high efficiency, low VOC emissions, and superior performance.

The global UV Oligomers and Monomers market size was estimated at USD 3234.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
