Abstracts

Ultraviolet (UV) releasable adhesives are specialized formulations designed to temporarily bond substrates through curing upon exposure to UV light, then facilitate clean and residue-free separation when subjected to a secondary, typically longer or more intense, UV exposure that degrades the adhesive layer. These materials are engineered to offer strong initial adhesion for assembly, handling, or processing purposes, with the unique capability of on-demand debonding, making them particularly valuable in applications requiring non-destructive disassembly, such as in electronics manufacturing for temporary component fixation, semiconductor processing for wafer mounting, medical device assembly, and prototyping where parts may need repositioning or retrieval. The technology relies on photolabile chemical groups within the polymer matrix that break down under specific UV wavelengths, enabling controlled release without mechanical force, heat, or solvents, thus minimizing damage to sensitive components and improving efficiency in high-precision industries.

The global Uv Releasable Adhesives market size was estimated at USD 750.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
