Abstracts

Ultraviolet (UV) food sterilizers are devices that use short-wavelength ultraviolet light, specifically UV-C radiation, to inactivate or destroy microorganisms such as bacteria, viruses, molds, and yeasts on the surface of food products, packaging materials, and food preparation equipment. These systems operate by exposing items to UV light, which damages the DNA or RNA of pathogens, rendering them unable to reproduce or cause contamination. UV sterilizers for food are used across various applications, including disinfecting fresh produce, extending shelf life, sterilizing food contact surfaces, and treating water used in food processing, offering a chemical-free, non-thermal method to enhance food safety and quality without altering taste, texture, or nutritional value.
