## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on UVC Upper Air Disinfection Unit competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. UVC Upper Air Disinfection Unit is an intelligent device that uses UVC ultraviolet rays of a specific band to carry out targeted disinfection of the upper air in the room. It installs ultraviolet lamps in an area more than 2.3 meters above the ground and cooperates with shading shutters and reflectors to ensure that ultraviolet rays only act on the height of the equipment or higher spaces to avoid direct exposure to the human body. At the same time, forced air circulation or natural convection is used to make the indoor air continuously flow through the disinfection area, and the destructive effect of ultraviolet rays on microbial nucleic acids (DNA/RNA) is used to achieve efficient sterilization. It is suitable for crowded places such as hospitals, schools, and offices. Its advantage is that it can achieve continuous disinfection in an environment where humans and machines coexist, and there is no risk of ozone leakage during operation.

The global UVC Upper Air Disinfection Unit market size was estimated at USD 154.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
