Abstracts

Ultraviolet C (UVC) upper air disinfectors are specialized ceiling-mounted or wall-mounted devices designed to inactivate airborne pathogens by emitting germicidal UVC light (typically in the 254 nm wavelength range) within the upper portion of a room, where air circulates naturally or through mechanical systems, without exposing occupants in the lower occupied zone to harmful radiation. These systems work by drawing contaminated air into an enclosed upper chamber, exposing it to UVC irradiation that damages the DNA or RNA of microorganisms such as viruses, bacteria, and mold spores, thereby reducing their ability to replicate and decreasing the overall microbial load in indoor environments. They are particularly valued in settings requiring continuous disinfection?such as healthcare facilities, schools, offices, and public transport hubs?as a complementary measure to traditional cleaning, enhancing indoor air quality and mitigating infection transmission risks.

The global Uvc Upper Air Disinfector market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
