Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on V Cut PCB Depaneling Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. V-cut PCB depaneling machine is an automated equipment specially used for the printed circuit board (PCB) splitting process. It is mainly used to separate multiple connected panels along the pre-designed V groove accurately and efficiently. The equipment cuts along the predetermined track through the upper and lower circular knives or cutter wheels without damaging the electronic components and wiring, which can significantly reduce the stress of depaneling and improve the product yield. V-Cut depaneling machines are widely used in the production of standardized small and medium-sized boards such as consumer electronics, LED lighting, automotive electronics, and communication equipment, and are suitable for materials such as FR4 and aluminum substrates. Modern V-cutting machines are often equipped with CCD visual positioning, automatic feeding systems, and PLC touch control interfaces. Some high-end models support repeatability within $\pm 0.05\text{mm}$, which is suitable for high-density assembly and automated production line requirements. Due to its low equipment cost, simple maintenance, and high operating efficiency, it still maintains a high market share in the depaneling process.

The global V Cut PCB Depaneling Machine market size was estimated at USD 86.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
