Vacuum Assisted Closure (VAC), also known as Negative Pressure Wound Therapy (NPWT), is a medical technique that uses controlled, localized negative pressure to promote wound healing by removing excess exudate, reducing edema, stimulating granulation tissue formation, and improving blood flow to the wound bed. The system typically consists of a specialized dressing, an evacuation tube, a canister for fluid collection, and a portable or stationary pump that generates and regulates the negative pressure, creating a closed, moist wound environment conducive to healing while helping to protect the wound from external contaminants.
