## Abstracts

Porosity is a predominant issue in any traditional die casting process. It severely affects the casting integrity, thus compromises the quality and performance. So, a vacuum system is utilized in a pressure die casting process to avoid this as much as possible. It is known as vacuum-assisted high pressure die casting, or in short, vacuum die casting. Vacuum die casting is an advanced die casting process to eliminate or significantly reduce the pores and dissolved gas in the die casting parts by pumping out the gas in the die-casting die cavity in the die-casting process, so as to improve the mechanical properties and surface quality of the die-casting parts. In vacuum die casting, the air in the die casting cavity is pumped out first, and then the liquid metal is pressed in. It can eliminate or reduce the air hole in the die casting and improve the mechanical properties and surface quality of the casting; During die casting, the backpressure of the cavity is greatly reduced, and the alloy with low specific pressure and poor casting performance can be used.

The global Vacuum Die Casting market size was estimated at USD 6587.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
