Abstracts

A vacuum hot water boiler is a high-efficiency heating system that operates under negative pressure, utilizing the principle that water boils at lower temperatures in a vacuum environment, thereby producing hot water with reduced energy consumption and enhanced safety by eliminating the risk of explosion associated with pressurized systems. These boilers are commonly used in residential, commercial, and industrial applications for space heating and domestic hot water supply, offering advantages such as longer equipment lifespan, lower operational costs, and reduced scaling due to the closed-loop vacuum-sealed design that minimizes oxygen intrusion and corrosion.

The global Vacuum Hot Water Boiler market size was estimated at USD 2250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
