Abstracts

A vacuum-induced autoclave, also known as a pre-vacuum or vacuum-assisted autoclave, is an advanced sterilization device that enhances the sterilization process by removing air from the chamber before steam is introduced. This is achieved through a series of vacuum pulses that evacuate the air, ensuring that steam can penetrate even the most complex and tightly packed instruments, which might not be effectively sterilized in a gravity autoclave. The vacuum-induced process allows for faster and more thorough sterilization, making it ideal for sterilizing items with lumens, porous materials, and densely packed loads. Widely used in medical, dental, and research settings, these autoclaves ensure higher sterilization standards, particularly for critical instruments that require rigorous decontamination.

The global Vacuum Induced Autoclave market size was estimated at USD 1053.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
