### **Report Overview**

The Vacuum Induction Melting Inert Gas Atomization (VIGA) system is a sophisticated process used in the production of high-quality metal powders. It involves melting metal using an induction furnace under a vacuum to eliminate contaminants and achieve a high-purity melt. Once the metal is molten, it is poured through a nozzle and atomized by a high-pressure stream of inert gas, such as argon or nitrogen, which breaks the liquid metal into fine droplets. These droplets solidify rapidly as they cool down, forming spherical or near-spherical metal powders. This method is particularly valued for its ability to produce powders with controlled composition, minimal oxidation, and uniform particle size, which are essential for applications in advanced manufacturing technologies such as additive manufacturing, powder metallurgy, and the production of high-performance materials.

The global Vacuum Induction Melting Inert Gas Atomization System market size was estimated at USD 308 million in 2023 and is projected to reach USD 383.98 million by 2030, exhibiting a CAGR of 3.20% during the forecast period.

North America Vacuum Induction Melting Inert Gas Atomization System market size was USD 80.26 million in 2023, at a CAGR of 2.74% during the forecast period of 2024 through 2030.
