## Abstracts

A vacuum interconnect system is a specialized assembly of components designed to establish and maintain a vacuum-tight connection between different sections of vacuum chambers or equipment, enabling the transfer of materials, energy, or signals without compromising the integrity of the vacuum environment. These systems typically include flanges, seals, valves, feedthroughs, and manipulators, and are engineered to meet stringent requirements for ultra-high vacuum (UHV) or high vacuum (HV) conditions, ensuring minimal outgassing, high thermal stability, and resistance to contamination. They are critical in applications where precise control of the internal atmosphere is essential, such as in semiconductor manufacturing, particle accelerators, space simulation chambers, and thin-film deposition processes, where even minor leaks or impurities can significantly impact performance, yield, or experimental results.

The global Vacuum Interconnect System market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
