Abstracts

Vacuum Soldering System refers to a type of equipment used in electronics manufacturing for soldering components onto circuit boards or assemblies under vacuum conditions. These systems typically consist of a vacuum chamber, soldering equipment (such as solder paste dispensers or soldering irons), heating elements, and controls for temperature and vacuum levels. The primary purpose of a vacuum soldering system is to create a controlled atmosphere with reduced oxygen levels during the soldering process. This helps prevent oxidation of solder and components, leading to improved solder joint quality, reduced defects, and increased reliability of electronic assemblies. Vacuum soldering systems can vary in complexity and design, ranging from small benchtop units for prototyping and small-scale production to large-scale automated systems for high-volume manufacturing. They are commonly used in industries such as electronics manufacturing, aerospace, automotive, and medical devices where high-reliability soldering is crucial. Global key players of Vacuum Soldering System include Rehm Thermal Systems, SMT Wertheim, Heller Industries, etc. The top three players hold a share over 46%. Europe is the largest market, with a share about 50%, followed by Asia-Pacific and North America, with share 36% and 12%, separately. In terms of product type, Inline Vacuum Soldering System is the largest segment, occupied for a share of 57%. In terms of application, Power Semiconductors is the largest, which has a share about 67 percent.

The global Vacuum Soldering System market size was estimated at USD 137.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
