Report Overview

The core principle of the vacuum spin coater is to use a rotating table to fix the substrate and rotate it at high speed, while the liquid coating material is dripped onto the center of the substrate through a nozzle. The centrifugal force generated by the rotation makes the coating material spread evenly from the center to the surroundings, forming a thin and uniform coating. The whole process is carried out in a vacuum environment, which can avoid the influence of impurities and oxides in the air on the coating quality.
