Abstracts

Valley fever medication encompasses a range of pharmaceutical treatments designed to manage coccidioidomycosis, an infection caused by inhaling spores of the *Coccidioides* fungi endemic to arid regions of the southwestern United States, parts of Mexico, and Central and South America. These medications include antifungal agents such as fluconazole, itraconazole, and amphotericin B, which are used based on disease severity, patient immune status, and manifestation (e.g., pulmonary, disseminated, or chronic forms). While many cases are self-limiting and may not require treatment, medication becomes critical for high-risk groups, including immunocompromised individuals, pregnant women, and those with severe or progressive disease. The market is shaped by regional epidemiology, diagnostic trends, and evolving clinical guidelines, with treatment strategies focusing on both acute management and long-term suppression in recurrent cases.

The global Valley Fever Medication market size was estimated at USD 52.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
