### Report Overview

Valves are devices that are used to control, direct, and regulate the flow and pressure of gases, liquids, and fluidized solids. These valves can be operated electrically, pneumatically, and hydraulically.

This industry research report identifies the increase in number of combined cycle gas turbine (CCGT) power plants to be one of the major factors that will have a positive impact on the growth of this market in the coming years. Coal is the most commonly used fuel for power production. Though coal power plants are preferred over other power plants due to the cost factor, the increasing focus of governments and environmentalists in reducing the emission of greenhouse gases, has resulted in the rise in number of natural gas-based power plants. The increased production of natural gas, the decrease in its prices, and stringent emission norms implemented in several developed countries, will compel the power sector to transition from fossil fuel power generation to CCGT technology that also has benefits such as less emission of CO<sub>2</sub>, NO<sub>x</sub>, and SO<sub>2</sub> when compared to coal-powered plants. Since gas turbines use valves in several applications including fuel control, false start drain, inlet guide vane actuation, air purge control, and reverse flow prevention, the expected increase in the number of CCGT gas turbines in the coming years, will drive the growth of this market.
