Abstracts

A van wheel speed sensor, also known as an ABS (Anti-lock Braking System) sensor, is a critical electronic component located at each wheel hub that monitors the rotational speed of the wheels and transmits real-time data to the vehicle's electronic control unit (ECU). This data is essential for the proper functioning of safety systems such as ABS, traction control (TCS), and electronic stability control (ESC), as it allows these systems to detect wheel slip, lock-up, or loss of traction and intervene accordingly to maintain vehicle stability and braking efficiency. Typically using electromagnetic or Hall-effect technology, the sensor generates a signal proportional to wheel speed, which the ECU uses to make split-second adjustments to brake pressure or engine power, thereby enhancing driver control and safety, particularly in adverse road conditions.

The global Van Wheel Speed Sensor market size was estimated at USD 655.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
