Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Vapor-Phase Nano-Titanium Dioxide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of vapor-phase nano-titanium dioxide will reach 39,000 tons, with an average selling price of US\$3,000 per ton. Vapor-phase nano-titanium dioxide is produced by evaporating or vaporizing precursors such as titanium tetrachloride, followed by hydrolysis or oxidation in a high-temperature vapor phase, directly condensing to form nano-TiO₂ powder. The anatase crystal form predominates, often accompanied by a small amount of stable rutile. The final product typically exhibits extremely high purity (>99.5%), nanoscale particle size (primary particle size approximately 20 nm), a high specific surface area (tens to hundreds of square meters per gram), a chain-like aggregate structure, and hydrophilic properties characterized by abundant hydroxyl groups on the surface. TiO₂ produced by this vapor-phase method not only has a short synthesis cycle, is compatible with continuous production equipment, and eliminates mother liquor contamination, but also exhibits excellent thermochemical stability and photocatalytic properties. Vapor-phase nano-titanium dioxide is produced upstream from titanium concentrate, supplied by Tronox, Toho Titanium, and RTI International Metals. Its downstream application is in coatings, with representatives from PPG, AkzoNobel, and Sherwin-Williams. It is also used in cosmetics by companies such as L'Oréal and Shiseido.

The global Vapor-Phase Nano-Titanium Dioxide market size was estimated at USD 117.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
