Report Overview:

Varactor Diodes also known as a variable capacitance diode, varicap diode or variable reactance diode, is a diode that has a variable capacitance which is a function of the voltage that is impressed on its terminals. Tuning / varactor diodes are operated reverse-biased, and therefore no current flows. However, since the thickness of the depletion zone varies with the applied bias voltage, the capacitance of the diode can be made to vary. Usually, the capacitance is inversely proportional to the depletion region thickness and the depletion region thickness is proportional to the square root of the applied voltage. Therefore, the capacitance is inversely proportional to the square root of the voltage applied to the diode.

The Global Varactor Tuning Diodes Market Size was estimated at USD 735.00 million in 2023 and is projected to reach USD 872.53 million by 2029, exhibiting a CAGR of 2.90% during the forecast period.
