Report Overview

Variable valve timing(VVT)system is used in marine engines to increase the efficiency of engines to produce more power at lower rates of rotations per minute (rpm) using optimum amounts of fuel. The VVT system in marine engines gives an increase of about 5% in fuel efficiency. VVT controls the timing of the intake valves so that sufficient amount of air is taken in to burn the fuel, enabling complete combustion and higher power output. Currently, VVT systems have more concentration among high-power output engines. High-power output engines in marine boats usually tend to have more power at high rates of rpm. Hence, OEMs have started adding VVT systems to efficiently bring power to low rates of rpm.

According to the report, one of the primary drivers in the market is growth of boating industry. Sales of powerboats in the US has increased about 80% in 2014.

Wakeboard/ski boats, personal watercraft, aluminum fishing boats, pontoon boats, and fiberglass runabouts consisted the majority of the powerboat sales in the US. One of the main drivers for the same is the increase in the number of boat shows in the US and the rise in the number of American participants for the same. The boating industry in the US has been positively affected by the recovery of the US economy, stronger job market, and decrease in fuel prices.
