Abstracts

Vector retrieval systems are computational systems used for efficient storage, indexing, and similarity searching of high-dimensional vector data. They map text, images, audio, or structured data into vector embeddings and utilize Approximate Nearest Neighbor (ANN) or exact search algorithms to achieve rapid similarity matching and retrieval of massive datasets. They are widely used in intelligent search, recommendation systems, natural language processing, computer vision, and knowledge graphs to support semantic understanding, content retrieval, and personalized services. Downstream applications of vector retrieval systems primarily cover AI-driven scenarios, including intelligent question-answering systems, enterprise knowledge base retrieval, recommendation systems, semantic search engines, image and video content search, natural language understanding applications, and intelligent customer service. These downstream scenarios rely on vector retrieval systems for fast and accurate similarity matching of high-dimensional embedded data, thereby improving information retrieval efficiency and user experience. The overall project gross profit margin is typically affected by system integration complexity, customization requirements, and the proportion of maintenance services, generally around 46%.

The global Vector Retrieval System market size was estimated at USD 3110.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 29.30% during the forecast period.
