Abstracts

A vehicle aided driving system (VADS) refers to a suite of electronic technologies designed to assist drivers in the operation of a vehicle, enhancing safety, comfort, and convenience without fully automating the driving process. These systems utilize a combination of sensors?such as cameras, radar, lidar, and ultrasonic detectors?along with onboard computers and software algorithms to perceive the vehicle?s environment, interpret data in real time, and provide warnings or intervene with corrective actions when potential hazards are detected. Common functionalities include adaptive cruise control, which maintains a set speed and distance from the vehicle ahead; lane-keeping assist, which helps prevent unintentional lane departures; automatic emergency braking, which applies brakes to avoid or mitigate collisions; blind-spot monitoring; and parking assistance features. Unlike fully autonomous systems, VADS requires the driver to remain engaged and responsible for overall vehicle control, serving as a co-pilot rather than a replacement, with the primary goals of reducing human error, improving reaction times, and mitigating accident risks across various driving conditions.

The global Vehicle Aided Driving System market size was estimated at USD 47200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
