Report Overview

Aluminium extrusion is a technique used to transform aluminium billets into objects with a defined cross-sectional profile for a wide range of uses. In the extrusion process, heated aluminium billet is forced through a die. Extrusions can be manufactured in many sizes and in almost any shape. The extrusion process makes the most of aluminium's unique combination of physical characteristics. Its malleability allows it to be easily cast and machined. Aluminium is one-third the density of steel but has the same stiffness, so the resulting products offer strength and stability, particularly when alloyed with other metals.

The global Vehicle Aluminum Extrusions market size was estimated at USD 24550 million in 2023 and is projected to reach USD 25907.97 million by 2032, exhibiting a CAGR of 0.60% during the forecast period.
