### Report Overview:

When the control and improvement of the engine reaches a certain emission level, the catalytic converter is necessary to meet further strict emission regulations. Usually the catalytic converters used in gasoline and diesel engines are different. The early catalytic converters of gasoline engines were only two-effect (two-bed), that is, only CO and HC were processed. With the stricter emission regulations and restrictions on NO<sub>x</sub> in various countries, three-way catalytic converters (three-way catalytic converters) are now used. When the exhaust gas passes through the catalytic converter, under the catalysis of these catalysts, CO and HC undergo a chemical reaction with O<sub>2</sub> (called an oxidation reaction), so that HC generates H<sub>2</sub>O, CO becomes CO<sub>2</sub>, and NO<sub>x</sub> is reduced to O<sub>2</sub> and N<sub>2</sub>.

The Global Vehicle Exhaust Emission Control Equipment Market Size was estimated at USD 901.31 million in 2023 and is projected to reach USD 1160.33 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
