### Report Overview

Vehicle-Mounted Runway Friction Tester is a specialized vehicle used to measure the friction coefficient of airport runways, taxiways, and aprons. It is also known as a skid resistance tester or friction measuring device. The vehicle is equipped with a set of rotating test wheels that mimic landing and braking forces on the runway surface. The wheels are covered with a rubber compound to simulate the contact between an airplane tire and the runway. The vehicle measures the friction between the test wheels and the runway surface, providing information on how slippery the surface is for aircraft landing and takeoff. The friction measurement is critical for ensuring the safety of aircraft operations. Low friction values on the runway surface can result in airplane skids or overruns, leading to accidents and injuries. Therefore, airport authorities must regularly check the friction coefficient of their runways and take corrective actions based on the test results. Vehicle-Mounted Runway Friction Testers have become a critical tool for airports worldwide to maintain safe and consistent runway conditions. They are designed to provide reliable and precise measurements even in adverse weather conditions, ensuring that the airport remains safe and operational.
