Abstracts

A Vehicle NVH Simulator is a specialized integrated testing and development tool designed for reproducing, analyzing, and optimizing the noise, vibration, and harshness (NVH) performance of vehicles (passenger cars, commercial vehicles, new energy vehicles, etc.) throughout the product development cycle. It integrates core technologies such as multi-channel vibration-acoustic excitation systems, real-time data acquisition, virtual reality (VR) interaction, and digital twin modeling to construct a high-fidelity virtual or semi-physical test environment: by simulating actual operating conditions (e.g., engine combustion, road irregularities, wind resistance, motor operation), it reproduces vibration transmission paths (e.g., chassis, body, interior) and acoustic radiation characteristics (e.g., engine noise, tire noise, wind noise) in a lab setting. Engineers can quantify key NVH metrics (e.g., sound pressure level, vibration acceleration, sound quality parameters) through real-time monitoring, identify potential issues (e.g., resonance, structural-borne noise, electromagnetic whine), and verify optimization solutions (e.g., adjusting damping structures, optimizing material properties, improving aerodynamics) without physical road testing.

The global Vehicle NVH Simulator market size was estimated at USD 81.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
