Abstracts

The Veno Venous Extracorporeal Membrane Oxygenation (VV ECMO) System is a specialized life-support technology designed to provide prolonged cardiac and respiratory assistance to patients whose heart and lungs are unable to sustain adequate gas exchange or perfusion, specifically by draining deoxygenated blood from a central vein, oxygenating it externally through a membrane oxygenator, removing carbon dioxide, and returning the oxygenated blood back to the venous system, thereby allowing the native organs to rest and recover during severe respiratory failure such as that caused by ARDS, pneumonia, or trauma, without directly supporting cardiac function like veno-arterial ECMO systems do.

The global Veno Venous Ecmo System market size was estimated at USD 275.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.18% during the forecast period.
