Report Overview

A Ventilated Curtain Wall is a non-structural, exterior building envelope system designed to provide thermal insulation, weather protection, and aesthetic appeal to a building's facade. It consists of a series of panels, typically made from materials such as glass, metal, or composite materials, that are attached to the building's structural frame. The key feature of a ventilated curtain wall is the presence of an air cavity or gap between the outer and inner layers of the wall, which allows for natural ventilation and heat exchange. This design not only enhances energy efficiency by reducing heat transfer but also helps in managing moisture and condensation, thereby improving the overall durability and longevity of the building envelope. The system is often used in modern architecture to achieve a sleek, contemporary look while maintaining functional performance.
