Report Overview

Ventilated facades, also known as curtain walls, are a type of non-structural building envelope system that is designed to provide both aesthetic appeal and functional benefits to a building. This system consists of an outer layer of panels, typically made from materials such as glass, metal, or stone, which are attached to the building's structural frame, creating a gap or cavity between the facade and the building's interior. This gap allows for natural ventilation, helping to regulate temperature and humidity, reduce energy consumption, and protect the building's interior from external elements. Ventilated facades are often used in commercial and high-rise buildings due to their ability to enhance the building's appearance, improve energy efficiency, and extend the lifespan of the building envelope.
