Report Overview

Vermiculite is a group of hydrated phyllosilicates, which are minerals that have a layered structure. It is composed mainly of hydrated magnesium, iron, aluminum, and potassium, and is characterized by its ability to expand when heated, a property known as exfoliation. This expansion is due to the release of water vapor from the mineral's structure, causing it to swell and form a lightweight, porous material. Vermiculite is often used in horticulture as a soil amendment to improve aeration and water retention, and in construction as an insulating material due to its heat-resistant properties. Additionally, it is utilized in various industrial applications such as filtration, fireproofing, and as a carrier for pesticides and fertilizers. Vermiculite's unique properties make it a versatile substance with a wide range of uses across different industries.
