Abstracts

The vertical film biaxial stretching machine is a test equipment specially used to test the mechanical properties of film materials under biaxial stretching conditions. The equipment simulates the stress conditions of the film in actual applications and performs biaxial stretching tests on the film to evaluate its tensile strength, elastic modulus, tear strength and other mechanical performance indicators. The vertical film biaxial stretching machine adopts a vertical structure, which makes the equipment occupy a small area and easy to operate. The working principle of the vertical film biaxial stretching machine is to clamp the film sample on a special clamp, and then biaxially stretch the film through two sets of vertical telescopic stretching mechanisms. During the stretching process, the equipment will record and display the film's tensile force, tensile displacement, stretching speed and other parameters, and calculate the film's mechanical performance indicators based on these parameters.

The global Vertical Film Biaxial Stretching Machine market size was estimated at USD 94.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
