Abstracts

A vertical LED chip's only emitting surface is on the top of the chip, thus it has a narrower light emitting angle with more light on axis and higher on-axis intensity. The vertical die has lower thermal resistance and the vertical structure transfers heat more efficiently for better dissipation. Many standard flip-chip LEDs cannot support a high current density due to the limitations of horizontal current flow, but the vertical chip can tolerate a higher current intensity? a higher driving current. This means it can deliver higher flux per LED and higher lumen density, or ?chip luminance? (the nits of the chip).

The global Vertical LED Chip market size was estimated at USD 2085.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
