Report Overview:

Wood chippers, regardless of their orientation, are used to process wood waste into smaller chips or mulch. They consist of a feed hopper, a cutting mechanism, and a discharge chute. The feed hopper is where the wood waste is loaded into the machine. The cutting mechanism, which usually consists of sharp blades or hammers, chips and shreds the wood as it passes through. The chips or shredded material are then discharged through the chute.

Wood chippers are commonly used in various industries, including forestry, landscaping, agriculture, and biomass. They are used to process tree branches, logs, stumps, and other wood waste, reducing their size for easier disposal, recycling, or use as biomass fuel or landscaping mulch.
