Abstracts

The vessel anti-heeling system is an automatic tilt compensation system for ships, designed to keep the ship level during loading and unloading. When the ship tilts due to uneven cargo loading and unloading, strong winds or sharp turns, the system automatically detects the ship's tilt angle and automatically transfers water to compensate for the tilt and restore the ship to a level state. This ensures the safety and stability of the ship during loading and unloading, while improving operational efficiency.

The global Vessel Anti-Heeling System market size was estimated at USD 8404.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
