Abstracts

Vibracorer is a specialized sampling device used in marine and freshwater environments to collect sediment cores from the bottom. It consists of a drill bit or a coring tube attached to a vibrating mechanism. The vibrations generated by the device help to penetrate the sediment layers and extract a continuous core sample with minimum disturbance. The vibracorer is typically deployed from a research vessel and lowered to the target area. Once the desired depth is reached, the vibrating mechanism is activated, driving the drill bit or coring tube into the sediment. This action allows the core sample to be collected in a more intact and undisturbed state compared to traditional coring methods. Vibracorers are widely used in geological and environmental studies to obtain high-quality sediment samples for analyzing sediment composition, dating, paleoclimate research, and studying sedimentary processes and ecosystems.
