Report Overview

The basic format used to store videos is analog form. This analog data is either stored in DVDs or magnetic tapes. The advancements in technology has led to adoption of devices that can provide advanced features, such as live TV and recordings. Once such device is video decoder, it is a data-intensive video processing device, which is an integrated circuit chip that converts digital video signals to analog video format. The signals received as input are analog videos in a standard format and the output of the decoder can be obtained in any desired bits format as per the use. The signals generated are either sync, blanking, filed or lock signals. The demand for video decoder has been ever increasing since it allows users to make programmable changes in the video such as it changes the characteristics of the video by customizing hues, contrasts and other features. Video decoders are widely used in devices that capture video and frame grabbers.

The video decoders are in high demand in many sectors including automotive, professional, and consumer video applications. They are also widely being used in applications such as digital televisions, PDAs, PCs, handheld games, surveillance, video recorder/players, internet appliances/web pads, portable navigation and others. Increasing usage of live videos on social media is further expected to fuel the adoption of video decoders in the market. Increasing use of video decoders in amplified and virtual reality devices is a key trend in the market.
