Abstracts

A video double lumen tube is an advanced medical device designed for thoracic surgery and critical care applications, primarily to facilitate one-lung ventilation during procedures such as lung resection, thoracoscopy, or esophagectomy. It integrates a traditional double lumen tube?which isolates and independently ventilates each lung?with an integrated video camera system, typically at the distal tip, providing real-time visual guidance during placement and continuous monitoring of tube position and airway conditions. This enhances accuracy, reduces the risk of malpositioning or trauma, and allows clinicians to confirm optimal lung isolation visually, improving patient safety and procedural efficiency compared to conventional blind insertion techniques.

The global Video Double Lumen Tube market size was estimated at USD 145.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
