## Abstracts

A Video Flame and Smoke Detection System is an advanced fire safety technology that utilizes video cameras and sophisticated artificial intelligence (AI) powered video analytics to identify the presence of flames and smoke in real-time. Unlike traditional point detectors that require smoke or heat to physically reach a sensor, these systems continuously analyze video feeds for visual cues associated with fire, such as the characteristic flickering of flames, changes in color, shape, and motion patterns of smoke, or rapid changes in brightness. When these specific visual signatures are detected, the system triggers an alarm, often providing immediate visual verification of the incident to monitoring personnel. This technology offers significant advantages in environments where traditional detection methods are challenging, such as large open spaces, high ceilings, or areas with high airflow, as it enables much earlier detection and can pinpoint the exact location of the potential fire, allowing for quicker response and mitigation.

The global Video Flame and Smoke Detection System market size was estimated at USD 1997.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
