Abstracts

The video laryngoscope system is an advanced airway management device that integrates a high-resolution camera, light source, and display screen into a laryngoscope blade, providing real-time visualization of the glottis and vocal cords during intubation procedures. Unlike traditional direct laryngoscopes, which rely on direct line-of-sight alignment, video laryngoscopes transmit a magnified view to an external monitor, improving first-pass success rates and reducing complications, particularly in difficult airway scenarios. These systems often feature ergonomic designs, video recording capabilities, and compatibility with various blade types to accommodate different patient anatomies and clinical settings, making them essential tools in emergency medicine, anesthesia, critical care, and prehospital environments.

The global Video Laryngoscope System market size was estimated at USD 550.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
