Abstracts

Vinca alkaloids are a class of plant-derived compounds that are widely used in the treatment of cancer. They are extracted from the Madagascar periwinkle plant (*Catharanthus roseus*), formerly classified under the *Vinca* genus, which gives these compounds their name. The four major vinca alkaloids used in clinical settings are vincristine, vinblastine, vinorelbine, and vindesine. These alkaloids function as mitotic inhibitors, which means they interfere with cell division, making them particularly effective in halting the proliferation of rapidly dividing cancer cells. Vinca alkaloids exert their anticancer effects by binding to tubulin, a structural protein essential for microtubule formation during cell division. By disrupting the assembly of microtubules, vinca alkaloids prevent cancer cells from completing mitosis, leading to apoptosis or programmed cell death. This mechanism makes them valuable in chemotherapy regimens for various types of cancers, including leukemias, lymphomas, breast cancer, lung cancer, and testicular cancer.

The global Vinca API market size was estimated at USD 120.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
