Abstracts

Vinyl flooring plasticizers are chemical additives, primarily phthalates and non-phthalate alternatives such as DOTP, DINCH, and bio-based options, that are incorporated into polyvinyl chloride (PVC) resin during the manufacturing of vinyl flooring to impart flexibility, durability, and workability by reducing the glass transition temperature and preventing the material from becoming brittle. These substances function by embedding themselves between polymer chains, allowing them to move more freely, which enhances the product's resistance to cracking, improves its elasticity under stress, and ensures long-term performance under varying environmental conditions, making them indispensable for both rigid and flexible vinyl flooring applications in residential, commercial, and industrial settings.

The global Vinyl Flooring Plasticizers market size was estimated at USD 1200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
