Abstracts

Viral and non-viral vectors are delivery systems used to transfer genetic material into cells for therapeutic or research purposes. Viral vectors are modified viruses engineered to carry and deliver specific genes, taking advantage of their natural ability to infect cells. Common examples include adenoviruses, lentiviruses, and adeno-associated viruses (AAV). Non-viral vectors, on the other hand, are synthetic or naturally derived systems that do not rely on viruses. These include liposomes, nanoparticles, electroporation, and plasmid DNA. While viral vectors offer high efficiency in gene delivery, non-viral vectors are often preferred for their lower immunogenicity, easier production, and enhanced safety profiles.

The global Viral and Non-viral Vector market size was estimated at USD 867.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.20% during the forecast period.
