## Abstracts

virtual biopsy is a non - invasive or minimally invasive medical diagnostic technique that uses advanced imaging technologies and computer - based analysis to obtain detailed information about the structure, function, and pathological characteristics of tissues or organs within the body, mimicking the role of a traditional tissue biopsy. In a virtual biopsy, instead of physically removing a tissue sample through a surgical or invasive procedure, high - resolution imaging modalities such as magnetic resonance imaging (MRI), computed tomography (CT), ultrasound, or optical coherence tomography (OCT) are employed to capture detailed images of the target area. These images are then processed and analyzed using sophisticated software algorithms to extract quantitative and qualitative data about the tissue, including its cellular and molecular features, metabolic activity, and vascular patterns. This approach allows clinicians to make a more accurate diagnosis, assess the progression of diseases, and monitor the response to treatment without the risks and complications associated with traditional biopsies.

The global Virtual Biopsy market size was estimated at USD 730.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.30% during the forecast period.
