Abstracts

Virtual WiFi router software is an application that uses a computer or mobile device's hardware resources to simulate the functions of a Wi-Fi router. It transforms the device into a wireless hotspot, enabling other devices to connect to the internet via Wi-Fi. Unlike traditional hardware routers, virtual Wi-Fi routers do not require additional physical equipment but rely on the existing network adapters and software algorithms for virtualization. Such software typically supports multiple device connections, network sharing, and even wireless signal encryption and restriction. It is especially convenient for sharing an internet connection in public spaces, during travel, or when a physical Wi-Fi router is unavailable. In terms of product scope, virtual WiFi router software includes several core modules: hotspot creation, bandwidth management, network security, and device connection management. Users can easily set up or disable virtual hotspots and configure network security options such as password protection and encryption methods. Additionally, some software offers device access control features, allowing users to limit the number of devices that can connect to the hotspot, ensuring network stability and security. As technology advances, the functionality of virtual WiFi router software has expanded, supporting more customization options and more efficient network transmission protocols.

The global Virtual WiFi Router Software market size was estimated at USD 320.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
