Report Overview:

Virus filtration (VF) is a key step in an overall viral clearance process since it has been demonstrated to effectively clear a wide range of mammalian viruses with a log reduction value (LRV) >4 . The potential to achieve higher LRV from virus retentive filters has historically been examined using bacteriophage surrogates, which commonly demonstrated a potential of >9 LRV when using high titer spikes (e.g. 10(10) PFU/mL). However, as the filter loading increases, one typically experiences significant decreases in performance and LRV.

The Global Virus Filtration Market Size was estimated at USD 2692.46 million in 2023 and is projected to reach USD 5909.88 million by 2029, exhibiting a CAGR of 14.00% during the forecast period.
